

magic zoomclouds uses both the Yahoo! Content Analysis API as well as a custom ZoomCloud content analysis tool. When you create your cloud, ZoomClouds will go and fetch your RSS feed, and the cloud that you get at that moment is based only on whatever content is in your feed at that time, which usually is the last 10-15 posts. You as a user can control this variable and extend it to a larger time frame. Free.

8. **The Casual Courier**

The Casual Courier is a new web service which allows you to send physical packages by connecting you with independent traveling individuals willing to act as couriers. You are the one to select your human courier and you are the one setting the fee you are willing to pay. With casualcourier.com you can send a package for the cost of post, with the reliability of hand delivery, and at the speed of overnight service. Casual Courier extends its smart assisting hand also to complementary services like the so-called AirSitter Assistance, which allows you to find help for special-needs passengers as well as with another service called Container Sharing and which makes it easy for you to find space in existing large cargo containers which have unused space. 99 cents is the cost of accessing an identified matching courier plus whatever price you have set to offer for the service.
